

Section 4.1: Big O and Rates

Friday, October 11, 2019 10:50 AM

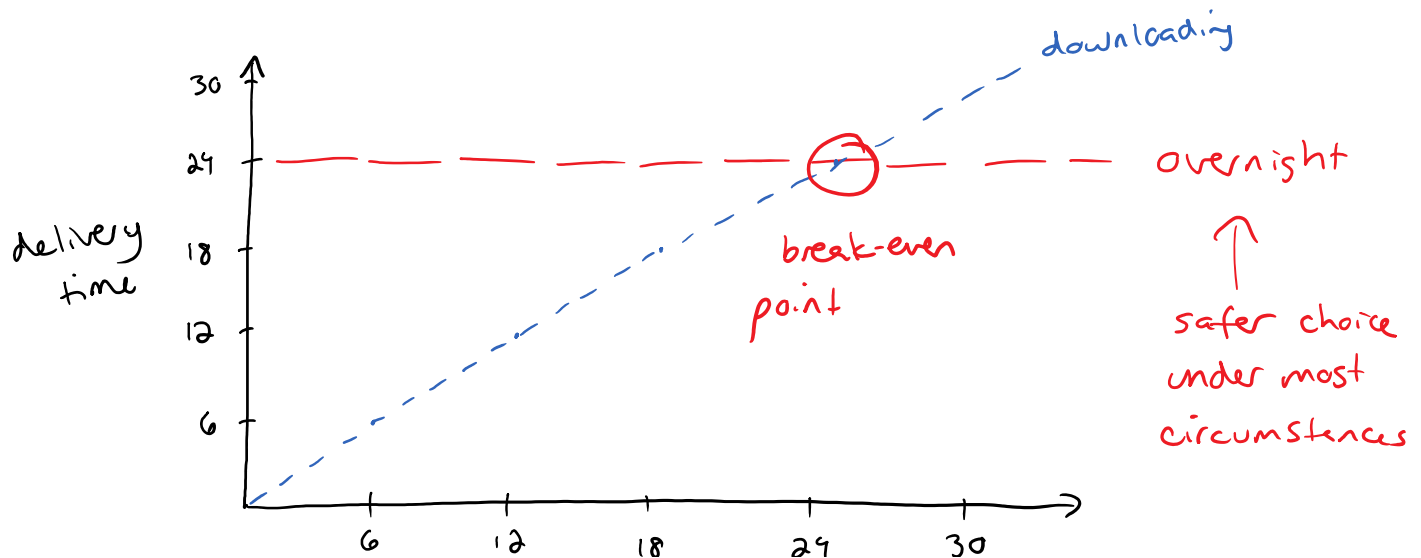

of Growth

example: Suppose you wish to download a number of Star Trek episodes. You can either download them at one episode per hour, or you could buy them on DVD from Amazon with overnight delivery (let's call that 24 hour delivery).

scenarios: minimum delivery time
(1 hour/episode vs 24 hours total)

- few episodes, < 24 , downloading faster
- break even, $= 24$, methods have the same time
- many episodes, > 24 , overnight faster

and if you don't know how episodes will be required, the "many episodes" scenario is the safest approach

in computing, we are often trying to minimize the number of operations necessary to run an algorithm

let's look at the number of steps required for two algorithms

① consider adding two S -digit numbers

$$\begin{array}{r} 12345 \\ + 52423 \\ \hline \end{array}$$

best-case: S additions,
one for each column

worst-case: S additions,
plus some carries

② consider multiplying two S -digit numbers

$$\begin{array}{r} 12345 \\ \times 52423 \\ \hline \times \times \times \times \times \\ \times \times \times \times \times \\ \times \times \times \times \times \\ \times \times \times \times \times \\ \times \times \times \times \times \\ \hline \end{array}$$

best case: 25 multiplications
plus 9 column additions

worst case: 25 multiplications
plus 10 column additions
plus lots of carries

the worrying part is the fact that the number of multiplications goes as the square of the number of digits

100 digits \rightarrow 10 000 multiplications! ouch!

Big O:

let n be the number of elements you are considering

(n is the number of digits in your number, or the number of Star Trek episodes)

- size of input

then O is the number of operations needed for the task

addition: if you double the number of digits, you approximately double the number of operations

Big O notation: $O(n)$
order n

multiplication: if you double the number of digits, you ^{approximately} quadruple the number of operations

$$O(n^2)$$

note: I will not ask you to analyze an algorithm and figure out Big O

so Big O only talks about the number of operations for large n

and in this graph, $O(n^2)$ will be larger than $O(n)$
