

# Section 1.4: Converting from Decimal

Monday, January 15, 2024 10:25 AM

we've converted from other bases to decimal -  
how do we go the other way?

background: whole numbers: 0, 1, 2, 3, ...

integers: ..., -3, -2, -1, 0, 1, 2, 3, ...

modular arithmetic

$$\frac{7}{4} = 1 \frac{3}{4} \quad \text{or} \quad 1.75$$

but if we stay with integers

$\frac{7}{4}$  has a quotient of 1 plus 3 left over  
whole number or integer part  
quotient  $Q$   
remainder  $R$

how do you find  $Q$  and  $R$  using a calculator?

$\frac{7}{4} = 1.75$  on calculator  
integer part 1  
non-integer part 0.75

$Q \rightarrow$

$0.75$

$$\text{remainder } R = 0.75 \times 4 = 3$$

note: how do you re-enter the non-integer part quickly?  
subtract the integer part

examples: find  $Q$  and  $R$  for

$$a) 50 \div 4 = 12.5$$

$$Q = 12$$

$$R = 0.5 \times 4 = 2$$

$$b) 92 \div 8 = 11.5$$

$$Q = 11$$

$$R = 0.5 \times 8 = 4$$

$$c) 133 \div 16 = 8.3125$$

$$Q = 8$$

$$R = 0.3125 \times 16 = 5$$

application: unit conversion

time: 45 days

$$= \underbrace{6 \text{ weeks}}_Q \text{ and } \underbrace{3 \text{ days}}_R$$

digression: will not be tested in this class

in computing, the modulus (or modulo) function computes the remainder left after dividing one integer by another

$$\text{mod}(5, 3) = 2$$

$$5 \text{ mod } 3 = 2$$

$$5 \% 3 = 2$$

recall: converting from octal to decimal

$$152_8 = 1 \times 8^2 + 5 \times 8^1 + 2 \times 8^0 = 106_{10}$$

how to go the other way?

repeated division

convert  $106_{10}$  to octal

	Q	R	
$106 \div 8$	13	$0.25 \times 8 = 2$	↑ write these digits in reverse order
$13 \div 8$	1	$0.625 \times 8 = 5$	
$1 \div 8$	0	1	

↑  
keep dividing until Q=0

answer: 152<sub>8</sub>

convert 58 to binary:

	Q	R
$58 \div 2$	29	0
$29 \div 2$	14	$0.5 \times 2 = 1$
$14 \div 2$	7	0
$7 \div 2$	3	1
$3 \div 2$	1	1
$1 \div 2$	0	1

111010<sub>2</sub>

convert 53710 to hexadecimal:

	Q	R
$53710 \div 16$	3356	<del>14</del> E
$3356 \div 16$	209	<del>12</del> C
$209 \div 16$	13	1
$13 \div 16$	0	<del>13</del> D

DICE<sub>16</sub>

convert 597 to base 5:

	Q	R
$597 \div 5$	109	2
$109 \div 5$	21	4
$21 \div 5$	4	1
$4 \div 5$	0	4

4142<sub>5</sub>

what about non-integer numbers?

instead of dividing by the base repeatedly,

we multiply

so to convert  $0.375_{10}$  to binary

→ multiply by the base and split it into the integer part and the non-integer part

	integer		non-integer
$0.375 \times 2 =$	0	+	0.75
$0.75 \times 2 =$	1	+	0.5
$0.5 \times 2 =$	1	+	0

↑  
 once this is  
 zero, you can stop

now take the integer part

$$0.375_{10} = 0.011_2$$

Section 1.4: cont'd 2024/01/16

example: convert 0.734375 to hexadecimal

$0.734375 \times 16 =$	<del>11</del>	B	+	0.75
$0.75 \times 16 =$	<del>12</del>	C	+	0

0.BC<sub>16</sub>

example: convert to binary: 0.8125

	int		non-int
$0.8125 \times 2 =$	1	+	0.625
$0.625 \times 2 =$	1	+	0.25
$0.25 \times 2 =$	0	+	0.5
$0.5 \times 2 =$	1	+	0

$$\begin{array}{rclcl} 0.25 & \times 2 & = & 0 & + & 0.5 \\ 0.5 & \times 2 & = & 1 & + & 0 \end{array}$$

$$\underline{0.1101_2}$$

an example with a twist:

convert 0.1 to binary

	int	non-int
$0.1 \times 2 =$	0	+ 0.2
$0.2 \times 2 =$	0	+ 0.4
$0.4 \times 2 =$	0	+ 0.8
$0.8 \times 2 =$	1	+ 0.6
$0.6 \times 2 =$	1	+ 0.2
$0.2 \times 2 =$	0	+ 0.4
$0.4 \times 2 =$	0	+ 0.8
$0.8 \times 2 =$	1	+ 0.6
$0.6 \times 2 =$	1	+ 0.2

this is going to be a repeating pattern to the right of the radix point since the non-integer part will never go to zero

$$\begin{aligned} 0.1_{10} &= 0.0011011011011011011011 \dots \\ &= 0.0\overline{0011}_2 \end{aligned}$$

convert 0.7 to octal:

	int	non-int
$0.7 \times 8 =$	5	+ 0.6

$0.7 \times 8 =$	int 5	+	non-int 0.6
$0.6 \times 8 =$	4	+	0.8
$0.8 \times 8 =$	6	+	0.4
$0.4 \times 8 =$	3	+	0.2
$0.2 \times 8 =$	1	+	0.6

$$0.7_{10} = 0.5\overline{9631}_8$$

putting it all together:

convert 19.96875 to octal. Give an **exact** answer.

don't round  
↓

integer part

	Q	R
$19 \div 8$	2	3
$2 \div 8$	0	2

non-integer part

	int	non-int
$0.96875 \times 8 =$	7	+ 0.75
$0.75 \times 8 =$	6	+ 0

answer: 23.76<sub>8</sub>
