Summary of translations: (translation means "shift")

rule: Consider the graph $y = f(x)$

the graph $y = f(x) + b$ is just the
graph of $y = f(x)$ shifted up by
"b" units

similarly, the graph $y = f(x) - b$ is just
 $y = f(x)$ shifted down by b

the graph $y = f(x - d)$ is just
the graph of $y = f(x)$ shifted right by d

the graph $y = f(x + d)$ is just the
graph of $y = f(x)$ shifted left by d.

the graph $y = -f(x)$ is just $y = f(x)$
flipped over x-axis

the graph

$$y = f(-x) \text{ is just } y = f(x)$$

flipped over $y = ax + 3$

Combining ideas:

sketch $f(x) = |-x|$

same as $f(x) = |x|$ because of symmetry

sketch $f(x) = -|x| + 3$

sketch $f(x) = |x+1| - 2$

$(-1, -2)$

note: we want be doing:

$$f(-x+2)$$
